

APPENDIX

EQUITY

SECF <GO>

Use the security finder to search for any security across any market or asset class. Once a security is loaded, you can then run single-security functions like DES and RV. Functions like WEI and BI, which look across multiple tickers, do not need a security loaded to run.

WEI <GO>

Use WEI (World Equity Indices) to compare regional indices against one another and to determine current and historical performance levels. You can use this comparative analysis to determine investment opportunities and how changes in global markets may affect the stocks in your portfolio. This information may help you determine which stocks to eliminate from the worst-performance markets and then allow you to choose better-performing markets that may increase the return on your portfolio.

BI <GO>

BI provides analysis on industries, companies, and expert topics, delivering key data and interactive charting from BI analysts with an average of seventeen years of experience in their given industry. Topics include government and legal issues; environmental, social, and governance (ESG) standards; and credit coverage. BI offers timely analysis that leverages Bloomberg's earnings consensus, price targets, ratings, and estimates products, and compiles extensive data across industries into one platform, so you can gain deeper insight into an industry or topic. BI allows you to download data, so you can create your own models and analysis.

MRR <GO>

Use MRR (Member Ranked Returns) to display the 10 best- and 10 worst-performing stocks of an index. MRR also ranks the returns of all the components of a selected index by simple price appreciation for a specified period. You can use MRR to compare member stocks to one another to determine which stocks are earning the highest returns.

FUNDAMENTAL ANALYSIS

DES <GO>

Use DES (Description) to display financial data and fundamental background information provided by the Bloomberg Professional service for a specific stock, warrant, mutual fund, equity option, synthetic option or ETF. The screens you encounter differ based on the type of equity you are evaluating.

RV <GO>

Use RV (Relative Value) to perform a customized peer group analysis using BICS, a proprietary industry classification system that places companies in multiple industries by revenue. Relative value analysis can be applied to companies (stocks), mutual funds or municipal bond issuers.

FA <GO>

Use FA (Financial Analysis) to display financial history for a specific company or equity index, identify trends and to gain data transparency so you can analyze the value of a potential investment, partnership or acquisition target. You can choose from a list of templates that display a variety of company information and add specific data fields to the selected template.

FA also provides aggregated fundamental data for more than 15,400 global indices and tracks more than 100 individual financial values. Values include income statement, balance sheet, cash flow, ratios and profitability measures. You can display this data on a quarterly, semiannual, annual or trailing 12-month basis. You can also compare the performance of a selected index to any equity security by using the comparison feature.

SPLC <GO>

Supply chain conditions provide crucial insights into a company's future; we offer a unique look at supply chain fundamentals—mapping business relationships across suppliers, customers and competitors for more than 35,000 companies globally.

EE <GO>

Use EE (Earnings Estimates) to display Bloomberg's earnings projections as well as projections from various third-party contributors for a specific equity. Bloomberg collects all earnings estimates for a company in one place, so you can quickly gauge market expectations.

GF <GO>

Aggregate a broad array of data in a single chart to see a company's financial situation in the broadest possible context. Add level or trend lines, estimates, debt offerings, insider transactions and more to understand past performance and gauge where a company's stock might move next. Include ratios, correlations and spreads in your chart to create powerful comparisons between companies, indices, custom composites, currencies, commodities and more. Save the settings for charts you create as custom templates for the securities that you follow regularly.

APPENDIX

CF <GO>

Use CF (Company Filings) to search for corporate filings related to a specific equity, municipal or mortgage security. You can also use CF to display related Securities and Exchange Commission's EDGAR (Electronic Data Gathering, Analysis, and Retrieval) filings and Canadian Securities and Exchange Commission (SEDAR) filings.

DVD <GO>

Use DVD (Dividend/Split Summary) to display the dividend/split history of a security or, in the case of a corporate security, the dividend/split history of the parent of the issuer of the security. DVD also displays Bloomberg Dividend Forecast (BDVD) where available. You can use DVD to determine how a security's gross (before tax) or net (after-tax) dividend yield contributes to its overall returns.

ANR <GO>

Use ANR (Analyst Recommendations) to display a list of analysts' recommendations, price targets, price target time periods and a consensus rating for a selected equity. The consensus rating is based on analyst recommendations and compiled by Bloomberg reporters and researchers around the world. ANR allows you to determine the latest analyst sentiment and identify which analysts have the most accurate equity ratings. You can also create/edit an analyst recommendation alert.

ANALYTICS

EQS <GO>

Use EQS (Equity Screening) to perform a sophisticated search for equity securities. You can choose from example screens or create and save your own screening criteria manually or with the aid of on-screen wizard functionality. Criteria may include universe categories, such as countries, exchanges, indices, security types, security attributes, security lists, as well as data categories, such as fundamentals, estimates, financial and price ratios, and technical fields. You can also create advanced formulas or score an equity screen directly from search results.

The EQS function includes the In/Out Monitor screen (IOM) that allows you to monitor which securities are added to or dropped from the Equity Screening (Results) screen.

FTST <GO>

Our equity platform helps you efficiently backtest your strategies, offering powerful support to help you build and evaluate investment ideas. You can screen across a huge universe of equities using a point-in-time database with 20 years of history for a complete picture of potential opportunities. And, you can test a broad range of factors, including custom factors, to gain a robust assessment of investment themes and models.

PORT <GO>

Our flagship application centralizes the crucial portfolio and risk analytics and data required by equity professionals. It seamlessly connects portfolio monitoring, characteristics, attribution, historical performance and scenario analysis with VaR, ex-post and ex-ante risk capabilities—in one convenient screen built for your workflow. You can pinpoint the sources of active risk in your portfolios with our fundamental risk factor models. PORT <GO> is an indispensable resource for equity investment managers.

COMP <GO>

COMP (Comparative Total Returns) compares the returns of a selected security to its benchmark index and industry group (if available) or with two other selected securities and indices. You can use COMP to evaluate a security's relative value and determine if it is outperforming other securities or indices.

ECO <GO>

Use ECO (Economic Release Calendars) to display, customize and manage multiple economic calendars. Economic calendars can be managed by region, country and event type, and can display current, historical and upcoming economic event details.

BETA <GO>

Use BETA to graph and display the historical sensitivity of a selected equity compared to a broad-based market index. You can use BETA to help determine an equity's risk level.

EQRP <GO>

Use EQRP to calculate the expected additional return (equity risk premium) sought above a specific country/region's risk-free rate when investing in a selected equity. You can use EQRP to help measure the relative risk/reward of investing in a selected equity and/or equity market.

WACC <GO>

Use WACC to display capital structure, theoretical weighted average cost of capital, economic value added, return on invested capital (ROIC) and economic value added spread (EVA Spread) for a selected company. You can customize default assumptions and data underlying the calculations to assist you in your analysis. You can also display historical WACC data and generate a PDF report of the current chart.

APPENDIX

AZS <GO>

AZS forecasts the probability of a selected company entering bankruptcy within the next two years. You can use AZS to evaluate the general financial condition of a company and the associated risk of investing in the selected security. AZS does not calculate a score for financial institutions as it was developed primarily for manufacturing companies.

M&A ANALYSIS

MA <GO>

Use MA to track real-time global mergers and acquisitions data and utilize relevant valuations and data analysis. MA displays a customizable homepage featuring announced top deals, regional activity, global activity trends, top deal advisors and industry activity data. MA also provides comprehensive search functionality that allows you to perform a quick or advanced mergers and acquisitions data search—and allows you to save each search that you perform for future use. The M&A Results screen provides a detailed data summary (based on the search criteria you specify) as well as five of the following additional data analysis tabs: Deal Breakdown, Capital Flow, League Table, Deal List, and Time Series. You can also export all data sets and charts to a Microsoft Excel spreadsheet or save charts as high-quality images for client use.

IPO <GO>

The new IPO is a comprehensive homepage for the Equity Capital Markets. Use IPO to monitor equity offerings by stage, industry sector, time period, currency or region. You can use IPO to compare year-over-year offerings performance data, display bar charts of the best and worst performers by offer-price-to-date-return percentage, or display a 12-month summary chart by amount or number of issues. You can also use IPO to access a custom company name search, underwriter rankings, Bloomberg World IPO indices and IPO news headlines.

CACS <GO>

Use CACS to display a list of corporate and municipal actions taken by a selected company or municipality. You can filter the information that appears by action type, date type or date range.

CACT <GO>

Use CACT/CLAC/BNKF to display a calendar of corporate and municipal actions, including stock buybacks, capital changes and distributions, so you can better understand how other companies are making capital and keep track of organizational changes. You can display information by date range and type, data source, action type and security type, as well as export to a Microsoft Excel spreadsheet.

FA <GO>

Use FA to display financial history for a specific company or equity index, identify trends and to gain data transparency so you can analyze the value of a potential investment, partnership or acquisition target. You can choose from a list of templates that display a variety of company information and add specific data fields to the selected template.

FA also provides aggregated fundamental data for more than 15,400 global indices and tracks more than 100 individual financial values. Values include income statement, balance sheet, cash flow, ratios and profitability measures. You can display this data on a quarterly, semiannual, annual or trailing 12-month basis. You can also compare the performance of a selected index to any equity security by using the comparison feature.

LEAG <GO>

Use LEAG/LALT to list underwriter/legal adviser rankings for the fixed-income, equity, equity-linked, syndicated loan and MTN & structured loans markets. Create market searches so you can examine the leading underwriters/legal advisers in a specific market or industry sector and evaluate their position relative to competitors. You can choose specific search criteria to create custom ranking tables using market variables, date ranges and/or specific underwriters/legal advisers.

FIXED INCOME

BTMM <GO>

Use BTMM (Bloomberg Treasury and Money Markets Monitor) to monitor all major rates, securities and economic releases for a selected country. BTMM provides a comprehensive picture of the current interest rate environment so you can react quickly to changing market conditions.

APPENDIX

GGR <GO>

Use GGR to monitor yield changes in government bond markets for individual countries. GGR also provides a global summary of government bill, note and bond rates.

IYC <GO>

Use IYC to display a menu of yield curve analytics. You can view the curves from different countries both currently and historically and run various scenarios. These scenarios can help you determine where returns have been in the past and where they may be in the future.

CRVF <GO>

CRVF allows you to search Bloomberg's database for curves that are relevant to your fixed income market analysis. Curves are organized by type or asset class, then further divided by country/region and/or sector. You can select as many curves as you need and then launch them directly in the Graph Curves (GC) function.

NIM <GO>

Use NIM to monitor news headlines and security data for new issue bonds, syndicated loans and preferred stocks. You can display a reverse chronological calendar of new issue information for a predefined or custom fixed-income market.

NIM also displays contact information you can use to send Bloomberg new or updated information for new or existing fixed-income issues you want added to the Bloomberg database.

RATC <GO>

Use RATC to display a list of current and historical credit ratings for various issuers. RATC allows you to evaluate the financial security of the issuer based on its ability to meet debt obligations. You can use the historical ratings to analyze the issuer's creditworthiness and to track upgrades, downgrades and other moves that reflect the issuer's fiscal strength and degree of risk.

RATC is issuer-based and can display up to 10,000 issuer ratings.

YA <GO>

Use YA to evaluate the relationship between price and yield based on different yield conventions for a selected corporate security. You can calculate the price or yield for a bond and determine the cash due at settlement as well as the future cash flows. You can also calculate sensitivity measures to determine the price sensitivity of the bond to changes in interest rates.

YAS <GO>

Use YAS to price a fixed-income security using spreads to a benchmark issue/benchmark curve, calculate risk/hedge ratios/cost of carry, display market data, pricing information, interpolated spreads to benchmark curves, descriptive/fundamental/rating data and relative value analysis. You can also use YAS to maintain a log of securities on which you have run a YAS yield and spread analysis as well as save/edit analysis notes.

WBF <GO>

Use WBF to monitor prices or display yields for active bond futures contracts from around the world. WBF allows you to choose the display criteria, giving you a customized view of the market.

SRCH <GO>

Use SRCH to search Bloomberg's comprehensive fixed-income database so that you can find bonds that best meet your investment needs. You can search by coupon, maturity, country, currency and structure type for government, corporate, structured notes and private securities. SRCH displays up to 5,000 securities based on your criteria.

ISSD <GO>

Use ISSD to display descriptive, financial, operating and economic information for a selected issuer. ISSD provides a quick overview of the financial data and operations of the issuer of the security, so you can thoroughly evaluate the ability of the issuer to repay its debt.

APPENDIX

CRPR <GO>

Use CRPR to display the most recent and previous credit ratings for a selected structured finance security (CMO/ABS/CMBS/CDO), so you can identify any changes in the security's risk.

DDIS <GO>

Use DDIS to display the maturity distribution of the outstanding debt for a selected issuer and analyze its ability to meet its obligations to its debt holders. You can display outstanding debt (bonds, loans or both) by maturity, payment rank, coupon type, redemption type or loan type in a graph and table. You can choose which issuing entities and what type of bond and/or loans are included in the analysis. You can also compare an issuer's debt maturity distribution at the end of a past quarter with the current quarter.

TRA <GO>

Use TRA to display total return analysis for a selected government, corporate or municipal bond versus a comparable risk-free benchmark bond given various interest rate scenarios. You can also use TRA to perform convexity and duration analysis.

TRA allows you to change assumptions such as horizon date and reinvestment rate, so you can better determine projected total return in different interest-rate environments.

Note – TRA also supports total returns based on net-asset-value (NAV) calculations, which you can specify in the MFDF (Funds Defaults) function. MFDF <HELP> displays further information on how to specify NAV total return calculations.

RVM <GO>

Use RVM to graph the historical spread of a selected bond's yield to the interpolated point on the Treasury curve that corresponds with the bond's maturity. You can use RVM to compare the current spread of a bond with its average spread to see whether the bond is currently trading rich (narrow) or cheap (wide). You can also track recent trends in the bond's performance versus the interpolated point on the Treasury curve.

SWAPS

USSW <GO>

Use USSW to monitor current interest-rate swap data and data on US government, agency, LIBOR, futures markets and economic statistics.

SWDF <GO>

Use SWDF to customize your swap rates and volatility contributor defaults for a variety of currencies. You can use these customized defaults in the interest-rates swap analytics on your Bloomberg Professional service.

FWCV <GO>

Use FWCV to analyze projected forward rates for fair market curves, interest-rate swap curves and government curves for three future dates. You can store up to five taxable and five tax-exempt curves as important benchmarks for your investment needs. You can also gauge how well FWCV historically predicted rates by comparing past projected rates with their corresponding actual rates. Forward curve analysis allows you to build an investment strategy that matches your interest-rate assumptions.

SWPM <GO>

Use SWPM to create, value and update interest-rate swaps and derivative securities. You can display and update curves and cash flows, and perform risk and scenario analyses for each leg of the swap and for the entire deal.

IRSB <GO>

Use IRSB to display a menu of global interest-rate swap monitors where current market rates of currency-based interest-rate swaps and swap spreads appear.

FWCM <GO>

Use FWCM to analyze projected forward rates for interest-rate swap curves out as far as 50 years. You can now perform additional analysis in other functions with the rates as they are tickerized. Some examples include the Historical Price Table function (HP), the Single Bond Hedge function (HG) and the Volatility Graph function (HVG).

APPENDIX

GC <GO>

Use GC to find, view and manage curves on the Bloomberg Professional service. GC allows you to view one or more curves for one or more dates, including monitoring curve changes in real time. GC provides a variety of views, including changes between dates, changes between curves and 3-D views.

ICVS <GO>

Use ICVS to customize a swap curve. ICVS allows you to choose the instruments for the short-end and middle-of-the-swap curve. You can also use ICVS to create and save multiple curves for each swap curve.

IRDD <GO>

Use IRDD to display descriptions for the interest-rate swaps that can be valued in the Swap Manager function (SWPM). You can also list all your interest-rate swaps and credit swaps.

ASW <GO>

Use ASW to calculate the relative value of a selected bond through the interest-rate swap market. You can use ASW to determine if it is better to enter into an asset swap versus purchasing a floating-rate instrument. You can also use ASW to determine how much money can be saved in interest costs by issuing a fixed-rate bond and swapping the fixed payments for floating payments.

OAS1 <GO>

Use OAS1 to calculate values for the early redemption features of the selected security so you can make relative value judgments based purely on credit risk. OAS1 allows you to create custom credit curves and to determine the implied volatility assumptions that the market uses to price bonds with redemption provisions. You can also compare bonds with different redemption features on a similar basis using four different models so you can identify better-valued securities.

YASN <GO>

Use YASN to price a selected structured note using OAS spreads to a yield curve. You can also calculate a curve with customized volatility assumptions, implicit option premiums within the structure, fixed-equivalent yields, and risk and hedge ratios to offset interest-rate risk.

VCUB <GO>

Use VCUB to calculate the interest-rate volatility and swaption volatility for the specified combination of strike, option term and swap tenor. VCUB captures the volatility smile/skew effect of in-the-money volatilities, at-the-money volatilities and out-of-the-money volatilities.

NSV <GO>

Use NSV to display and analyze annual/daily at-the-money (ATM) normal swaption volatility data. The data updates in real time.

MARS <GO>

Use MARS for risk management, stress-testing and scenario analysis of various derivatives strategies across asset classes. MARS allows you to upload a portfolio containing equity, FX, interest-rate and commodity derivatives and their underlying instruments, as well as vanilla bonds, floaters and structured notes. You can also calculate P/L and greeks and perform scenario analyses on any part of the portfolio.

MONEY MARKETS

MMR <GO>

Use MMR to display a menu of global money market rate monitors. MMR allows you to compare money market instruments to composite prices, third-party prices and electronic trading prices to quickly spot high-yielding instruments and maximize returns.

BTMM <GO>

Use BTMM (Bloomberg Treasury and Money Markets Monitor) to monitor all major rates, securities and economic releases for a selected country. BTMM provides a comprehensive picture of the current interest-rate environment so you can react quickly to changing market conditions.

FED <GO>

Use FED to display a central portal for information on the US Federal Reserve, including important news, FOMC releases, relevant functions and educational materials.

MMCV <GO>

Use MMCV to display money market yield within CRFV function. You can use them as benchmarks for relative value comparisons both on a current and historical basis. MMCV provides a variety of money market yield curves for money market securities around the world, enabling you to analyze your investment performance across multiple markets and currencies.

APPENDIX

MCUR <GO>

Use MCUR to display the interpolated money market yield for a given maturity for LIBOR or any other curve on the MMCV1 menu. By comparing the money market yield to its benchmark yield, you can determine if you are paying a fair price for your security. This information appears on the top two lines of your screen and does not disrupt your current display.

GA1 <GO>

Use GA1 to evaluate short-term funding strategies for money market instruments on a breakeven basis. GA1 can help you determine what maturities generate the greatest returns based upon your time horizon and interest rate assumptions.

GA2 <GO>

GA2 calculates the potential profit/loss that results in choosing one investment strategy over another. You can use GA2 to help determine which short-term investment strategy best suits your time horizon and interest-rate assumptions.

FWCV <GO>

Use FWCV to analyze projected forward rates for fair market curves, interest-rate swap curves and government curves for three future dates. You can store up to five taxable and five tax-exempt curves as important benchmarks for your investment needs. You can also gauge how well FWCV historically predicted rates by comparing past projected rates with their corresponding actual rates. Forward curve analysis allows you to build an investment strategy that matches your interest-rate assumptions.

PGM <GO>

Use PGM to look up money market programs. You can access a program description page and create and store individual money market securities according to the program type of a specific issuer. PGM can help you keep a record of any securities you purchase when you create and store them under your Bloomberg Professional service login.

STRUCTURED FINANCE ANALYTICS

HSST <GO>

Use HSST to display statistics on home sales and housing construction, completions and affordability.

BMMI <GO>

Use BMMI to research mortgage prepayment reports, credit performance, home equity statistics, real estate cleanup call reports, manufactured housing performance statistics and Bloomberg prepayment models.

CPH <GO>

Use CPH to display a table of generic monthly historical data for a selected mortgage-backed security (MBS), collateralized mortgage obligation (CMO) or mortgage pool. Data for pools and CMOs corresponds to the generic to which they are mapped. You can use CPH to compare (on separate screens) different securities' prepayment speeds and the rates at which they prepay. **NOTE** – You can also use CPH to graph the historical data (CPG <GO>).

CLC <GO>

Use CLC/CLCX to display data and statistics on the loans backing a collateralized mortgage obligation (CMO), a pool or an auto asset-backed security (ABS). CLC/CLCX allows you to easily follow the changes in a security's collateral—which can alter how risky a deal is from a credit perspective.

SPA <GO>

Use SPA to chart projected cash flow patterns for all tranches within the selected CMO/ABS/CMBS mortgage deal's credit group. SPA allows you to display the waterfall for the selected deal.

VALL <GO>

Use VALL/GALL to display a table or a graph of dealer prepayment assumptions for a mortgage-backed security's collateral over an interest rate range of +/- 300 basis points. VALL/GALL displays an average of these assumptions derived from the Bloomberg Median and allows you to customize the collateral type for analysis. You can use these functions to determine if a specific dealer's forecast is comparable to another dealer's forecast, allowing you to better gauge prepayment risk.

PVG <GO>

Use PVG to display a graph of the first five years of vector forecasts for a selected mortgage security. PVG allows you to customize the shifts in the security's interest rate and select the prepayment model for each forecast so you can determine prepayment rates based on your assumptions.

DV <GO>

DV displays information on how to generate, save and incorporate dynamic vectors into your analysis of mortgage-backed securities. You can use dynamic vectors to make your own assumptions about the speed of prepayments and adjust your return projections accordingly.

YT <GO>

Use YT to display a table and graph of yields/prices for a mortgage or structured-product security over multiple assumptions regarding price, prepayment, yields or spread. YT allows you to quickly compare market prices for a range of yields.

APPENDIX

WALG <GO>

Use WALG to graph the weighted average life (WAL) and principal payments of a selected mortgage-backed (MBS) or asset-backed security (ABS) under different prepayment scenarios. You can view WAL graphs constructed from the prepayment assumptions of different dealers. WALG allows you to gauge both call risk and extension risk for the selected security according to prepayment rate changes.

OAS1 <GO>

Use OAS1 to calculate values for the early redemption features of the selected security, so you can make relative value judgments based purely on credit risk. OAS1 allows you to create custom credit curves and to determine the implied volatility assumptions that the market uses to price bonds with redemption provisions. You can also compare bonds with different redemption features on a similar basis using four different models so you can identify better-valued securities.

PRICE DISCOVERY

FIPX <GO>

FIPX provides an integrated price discovery platform, combining MSG1 quotes (pricing from your messages), contributing dealer quotes, Bloomberg Generic pricing (BGN), Bloomberg Evaluated pricing (BVAL) and TRACE trade data. A graphical representation of the data provides a quick insight into the breadth of available pricing.

Use FIPX to determine a bond's value when evaluating individual securities, analyzing a potential trade or determining a mark to market.

ALLQ <GO>

ALLQ allows you to monitor current market data for a selected fixed-income security by contributed pricing sources. ALLQ provides price transparency by offering an overview of the firms pricing a selected security. ALLQ can also be used as a liquidity platform since you can execute trades through dealers with whom you have been privileged to trade. ALLQ refreshes pricing automatically and displays the time for each pricing update.

Use ALLQ to determine a security's current price/spread/yield and liquidity, and electronically trade the security.

QMGR <GO>

QMGR allows you to monitor all the prices you have received via messages and dealer contributor pages for which you are enabled for a security. You can navigate between three different views: All Quotes, Best Quotes and Last Quotes, and choose to monitor prices for one security or two securities simultaneously.

Use QMGR to determine where a security is being priced in the current market, the most active dealers and market makers in the security, if the security represents value to a client and the amount of liquidity in the security.

QR <GO>

QR provides a quote-by-quote or trade-by-trade history for a selected security from a specific pricing source. You can change the pricing source and set a date range for trend analysis.

Use QR to gauge a security's intraday price movement and determine the fair price for a bond.

TDH <GO>

TDH allows you to determine the historical level of trading activity in a TRACE-eligible security. TDH aggregates historical TRACE trade data, including size and direction (dealer buy, dealer sell and dealer-to-dealer), and provides graphical representations of trading activity and trends in spreads for quick analysis.

Use TDH to determine a security's historical pricing by the market, liquidity, trends in spread and performance.

ANALYTICS

YAS <GO>

YAS provides an integrated platform for security-level price, yield, spread and risk analysis. YAS allows you to navigate between tabs that show pricing information, descriptive data and historical spread graphs. You can also create a custom tab with the information that is most important to you.

Use YAS to price a fixed-income security using spreads to a benchmark issue or benchmark curve, and calculate risk, hedge ratios and cost of carry.

DESCRIPTIVE

DES <GO>

DES provides consolidated financial information about a specific corporate or government security, including issuance and redemption, identification numbers and ratings.

Use DES to review, in one place, all the descriptive information you need to evaluate, buy, sell and trade a bond. To simplify analysis, all the tools in DES remain the same regardless of the type of bond.

APPENDIX

RELATIVE VALUE

FIRV <GO>

FIRV allows you to determine the relative richness/cheapness of a bond using a variety of spread and trend analyses.

Use FIRV to evaluate the relative value of a bond versus itself and versus comparable bonds over a historical time period you choose. Compare the selected bond to its own historical spreads and to spreads from comparable bonds and sector averages.

COMB <GO>

COMB allows you to compare the relative value of a customizable list of corporate bonds or syndicated loans. You can use filters to find bonds/loans that share similar characteristics or import a list of bonds/loans that you have previously created and saved.

Use COMB to display customizable tables and charts analyzing the spreads, prices and descriptive characteristics of a list of comparable bonds or loans.

CRVD <GO>

CRVD allows you to analyze the relative value of an issuer's bonds versus the issuer's credit default swap curve.

Use CRVD to chart aggregated issuer bond spreads with the issuer's credit default swap curve while displaying the data behind the chart in tables. You can customize the set of bonds from the issuer that are included in the analysis. You can also customize the CDS spreads used in the analysis.

RV <GO>

RV allows you analyze the historical performance of a bond using different benchmark spreads or CDS basis so that you can understand the relative richness or cheapness of a bond.

Use RV to chart the historical yield of a selected bond, a selected benchmark and their spread. Correlation and regression analysis are also available in RV.

SS <GO>

SS allows you to compare two bonds that are potential swap candidates so that you can choose the best time to swap the bonds in order to maximize your profits.

Use SS to display an overview of the relationship between two selected securities, including a summary of spread, risk and proceeds differentials.

TICKETING

BXT <GO>/SXT <GO>

BXT and SXT allow you to communicate the details of a trade directly over the Bloomberg Professional service through an electronic ticket. The ticket includes descriptive data for the security, relevant trade calculations and any notes you want to accompany the trade. The completed ticket can be sent to other Bloomberg users via Bloomberg Message (MSG) and/or integrated with the VCON voice trade confirmation system.

Use BXT to write an electronic buy ticket. Use SXT to write an electronic sell ticket.

HEDGING

FIHG <GO>

FIHG provides an integrated platform for hedging single securities. You can compare hedging options and analyze residual risk and historical performance.

Use FIHG to identify efficient hedges to hedge rate, curve and credit risk and run a cost-benefit analysis across various hedging strategies.

FIHR <GO>

FIHR calculates the number of cash bonds or bond futures contracts you must buy or sell to hedge the interest-rate risk of a position in a bond you specify.

Use FIHR to assess and hedge the interest-rate risk of a bond position.

TED <GO>

TED allows you to calculate the spread between a corporate or government security (with 10 or fewer years to maturity) and a Euro-Futures strip. TED can also generate a spread using a deliverable futures contract. TED displays the rate of return for a bond and a Eurodollar contract in comparable terms. TED uses the cheapest-to-deliver bond for all calculations.

Use TED to determine if a bond position could benefit from the difference between the bond's yield and LIBOR contracts of a similar maturity.

ADDITIONAL FIXED-INCOME FUNCTIONS

BTMM <GO>

Use BTMM (Bloomberg Treasury and Money Markets Monitor) to monitor all major rates, securities and economic releases for a selected country. BTMM provides a comprehensive picture of the current interest-rate environment so you can react quickly to changing market conditions.

APPENDIX

GGR <GO>

Use GGR to monitor yield changes in government bond markets for individual countries. GGR also provides a global summary of government bill, note and bond rates.

IYC <GO>

Use IYC to display a menu of yield curve analytics. You can view the curves from different countries both currently and historically and run various scenarios. These scenarios can help you determine where returns have been in the past and where they may be in the future.

CRVF <GO>

CRVF allows you to search Bloomberg's database for curves that are relevant to your fixed income market analysis. Curves are organized by type or asset class, then further divided by country/region and/or sector. You can select as many curves as you need and then launch them directly in the Graph Curves (GC) function.

NIM <GO>

Use NIM to monitor news headlines and security data for new issue bonds, syndicated loans and preferred stocks. You can display a reverse chronological calendar of new issue information for a predefined or custom fixed-income market.

NIM also displays contact information you can use to send Bloomberg new or updated information for new or existing fixed-income issues you want added to the Bloomberg database.

RATC <GO>

Use RATC to display a list of current and historical credit ratings for various issuers. RATC allows you to evaluate the financial security of the issuer based on its ability to meet debt obligations. You can use the historical ratings to analyze the issuer's creditworthiness and to track upgrades, downgrades and other moves that reflect the issuer's fiscal strength and degree of risk.

RATC is issuer-based and can display up to 10,000 issuer ratings.

WBX <GO>

WBX allows you to compare and analyze sovereign debt cross market spreads.

Use WBX to select a country as the benchmark, measure its performance relative to other countries and determine which sovereign debt offers the best value.

WBMV <GO>

WBMV allows you to monitor sovereign debt movers in real time and determine which markets have the most price action.

Use WBMV to track the movement of 10-year benchmark bonds, 2-to-10-year yield spreads and 5-year CDS for developed countries and emerging markets. You can also access news stories to analyze why markets are moving.

CRVF <GO>

CRVF allows you to search Bloomberg's database for curves that are relevant to your fixed income market analysis. Curves are organized by type or asset class, then further divided by country/region and/or sector. You can select as many curves as you need and then launch them directly in the Graph Curves (GC) function.

SRCH <GO>

Use SRCH to search Bloomberg's comprehensive fixed-income database so that you can find bonds that best meet your investment needs. You can search by coupon, maturity, country, currency and structure type for government, corporate, structured notes and private securities. SRCH displays up to 5,000 securities based on your criteria.

ISSD <GO>

Use ISSD to display descriptive, financial, operating and economic information for a selected issuer. ISSD provides a quick overview of the financial data and operations of the issuer of the security, so you can thoroughly evaluate the ability of the issuer to repay its debt.

DDIS <GO>

Use DDIS to display the maturity distribution of the outstanding debt for a selected issuer and analyze its ability to meet its obligations to its debt holders. You can display outstanding debt (bonds, loans or both) by maturity, payment rank, coupon type, redemption type or loan type in a graph and table. You can choose which issuing entities and what type of bond and/or loans are included in the analysis. You can also compare an issuer's debt maturity distribution at the end of a past quarter with the current quarter.

APPENDIX

TRA <GO>

Use TRA to display total return analysis for a selected government, corporate or municipal bond versus a comparable risk-free benchmark bond under various interest-rate scenarios. You can also use TRA to perform convexity and duration analysis.

TRA allows you to change assumptions such as horizon date and reinvestment rate, so you can better determine projected total return in different interest-rate environments.

Note – TRA also supports total returns based on net-asset-value (NAV) calculations, which you can specify in the MFDF (Funds Defaults) function. MFDF <HELP> displays further information on how to specify NAV total return calculations.

FI FUTURES & OPTIONS

WBX <GO>

WBX allows you to compare and analyze sovereign debt cross market spreads.

Use WBX to select a country as the benchmark, measure its performance relative to other countries and determine which sovereign debt offers the best value.

WBMV <GO>

WBMV allows you to monitor sovereign debt movers in real time and determine which markets have the most price action.

Use WBMV to track the movement of 10-year benchmark bonds, 2-to-10-year yield spreads, and 5-year CDS for developed countries and emerging markets. You can also access news stories to analyze why markets are moving.

WIR <GO>

Use WIR to monitor the prices or yields for active interest-rate futures contracts from around the world. WIR allows you to choose the display criteria, thereby giving you a customized view of the market.

CTM <GO>

Use CTM to search for contracts. You can use a variety of filters and sorts to locate the specific contract for which you are searching as well as customize the table to display specific data.

CCRV <GO>

Use CCRV to access forward curves for futures contracts and OTC forwards. A futures curve is made up of all the contract months that are traded for a specific commodity on a specific exchange. If you are a trader or analyst, these curves help you determine where the markets indicate commodity prices will be in the future. You can also create custom curves that you can add to custom curve charts or sample curve charts.

DLV <GO>

Use DLV to calculate the cheapest-to-deliver ranking analysis for either conversion-factor or yield-based bond futures. You can use DLV to list all deliverable bonds for a selected futures contract and to identify the cheapest-to-deliver bond.

OMON <GO>

Use OMON to display real-time pricing and derived data for exchange-traded call and put options. You can customize multiple templates according to the option information you need, including implied volatility levels, risk measurements and historical volatility. Basic scenario analysis is available via Calc Mode with Overrideable option inputs and outputs. You can also filter the options according to center price, strike price and the exchange criteria you choose.

Note – The functions CALL <GO>, PUT <GO>, COAT <GO> and POAT <GO> are now consolidated into the function OMON <GO>.

The corresponding tab of the OMON function appears when you enter CALL <GO>, PUT <GO>, COAT <GO> or POAT <GO>.

OV <GO>

Use OV to calculate the value of a fixed-income option using custom pricing assumptions for government and corporate bonds. You can use OV to determine the value of over-the-counter (OTC) options by determining the option premium or the implied volatility used to calculate the premium.

HIVG <GO>

Use HIVG to graph the historical implied volatility and prices/yields for a selected security. HIVG helps you gauge historical price movement and volatility versus the market's prediction (implied) of volatility over time. You can use HIVG to identify trends in price direction, predict trends in future volatility or draw correlations between prices/yields and volatility.

APPENDIX

TRMS <GO>

Use TRMS to display the term structure of historical and implied volatility for an equity or equity index. You can use TRMS to compare the term structure of implied volatility across multiple underlyings, dates and measures/levels of moneyness.

FIHR <GO>

FIHR allows you to manage and hedge the interest rate risk of a bond position, interest rate swap, or fixed income future. It calculates the number of cash bonds or bond futures contracts you must buy or sell to hedge the interest rate risk of a position in a bond you specify.

REPO ANALYSIS DATA

BTMM <GO>

Use BTMM (Bloomberg Treasury and Money Markets Monitor) to monitor all major rates, securities and economic releases for a selected country. BTMM provides a comprehensive picture of the current interest-rate environment so you can react quickly to changing market conditions.

RPP <GO>

Repo pricing.

RRRA <GO>

Repo/reverse repo analysis. Simplified user interface. Moved extraneous information to settings.

COC <GO>

Use COC to analyze the purchase of a selected security with borrowed funds (repo) or the borrowing of a security by lending out funds (reverse repo). COC allows you to quickly view the basis point spread, price pick-up, net profit/loss, and the breakeven price and yield for a given repo agreement—so that you can measure the net profit realized or the loss incurred by entering into these transactions.

CALCULATORS

FPA <GO>

Use FPA to analyze the purchase of a selected fixed-income security with borrowed funds through forward pricing. Forward pricing derives its value from the spread between a bond's yield and the short-term cost of financing the bond, or the repo rate.

You can use FPA to facilitate communication between buyers and sellers by sending the FPA analysis to other Bloomberg Professional service users.

BSR <GO>

Use BSR to calculate the forward price for a selected bond's buy/sell back repo transaction for a one-year maximum period. You can specify the reinvestment rate of the coupons (if any), calculate the amount of bonds needed given a predetermined settlement amount, calculate a spot price from a forward price and incorporate security margins so you can measure the net profit or loss incurred by entering into this transaction.

YAS <GO>

Use YAS to price a fixed-income security using spreads to a benchmark issue/benchmark curve, calculate risk/hedge ratios/cost of carry, display market data, pricing information, interpolated spreads to benchmark curves, descriptive/fundamental/rating data and relative value analysis. You can also use YAS to maintain a log of securities on which you have run a YAS yield and spread analysis, as well as save/edit analysis notes.

HIGH YIELD/SYNDICATED LOANS/ DISTRESSED RESEARCH

NIM <GO>

Use NIM to monitor news headlines and security data for new issue bonds, syndicated loans and preferred stocks. You can display a reverse chronological calendar of new issue information for a predefined or custom fixed-income market.

SRCH <GO>

Use SRCH to search Bloomberg's comprehensive fixed-income database so that you can find bonds that best meet your investment needs. You can search by coupon, maturity, country, currency and structure type for government, corporate, structured notes and private securities. SRCH displays up to 5,000 securities based on your criteria.

LSRC <GO>

Use LSRC to search the universe of live syndicated loans available on the Bloomberg Professional service using custom criteria.

The data is based on public information and matches the loan data that appears on the Loan Tranche Description (DES) function. DES <HELP> displays further information. The search excludes facilities and combined tranches, such as a BC or a loan strip. User-created loans from the Private Security Update (PPCR) function are not included in the search. PPCR <HELP> displays further information.

APPENDIX

EQS <GO>

EQS (Equity Screening) performs sophisticated searches for equity securities. Use EQS to create and save your own screening criteria manually or with the aid of on-screen wizard functionality. Criteria may include universe categories, such as countries, exchanges, indices, security types, security attributes and security lists, as well as data categories, such as fundamentals, estimates, financial and price ratios, and technical fields.

RATC <GO>

Use RATC to display a list of current and historical credit ratings for various issuers. RATC allows you to evaluate the financial security of the issuer based on its ability to meet debt obligations. You can use the historical ratings to analyze the issuer's creditworthiness and to track upgrades, downgrades and other moves that reflect the issuer's fiscal strength and degree of risk.

CRVF <GO>

CRVF allows you to search Bloomberg's database for curves that are relevant to your fixed income market analysis. Curves are organized by type or asset class, then further divided by country/region and/or sector. You can select as many curves as you need and then launch them directly in the Graph Curves (GC) function.

RELS <GO>

Use RELS to gain insight into the types of expenditures a selected company may encounter and an overview of its capital structure. This comprehensive overview includes a company description, a comprehensive list of equity, debt, preferred, money market securities, major subsidiaries and brand names.

ISSD <GO>

Use ISSD to display descriptive, financial, operating and economic information for a selected issuer. ISSD provides a quick overview of the financial data and operations of the issuer of the security, so you can thoroughly evaluate the ability of the issuer to repay its debt.

DDIS <GO>

Use DDIS to display the maturity distribution of the outstanding debt for a selected issuer and analyze its ability to meet its obligations to its debt holders. You can display outstanding debt (bonds, loans or both) by maturity, payment rank, coupon type, redemption type or loan type in a graph and table. You can choose which issuing entities and what type of bond and/or loans are included in the analysis. You can also compare an issuer's debt maturity distribution at the end of a past quarter with the current quarter.

YAS <GO>

Use YAS to price a fixed-income security using spreads to a benchmark issue/benchmark curve, calculate risk/hedge ratios/cost of carry, display market data, pricing information, interpolated spreads to benchmark curves, descriptive/fundamental/rating data and relative value analysis. You can also use YAS to maintain a log of securities on which you have run a YAS yield and spread analysis, as well as save/edit analysis notes.

YTC <GO>

Use YTC to calculate yields to predetermined call dates for a selected security. YTC allows you to see the different yield scenarios at each possible redemption date, so you can better gauge the value of the bond based on your own redemption assumptions.

MUNICIPAL BONDS

SMUN <GO>

Use SMUN (Search for Municipal Issuers) to search for US municipalities that meet specific geographic and financial analysis criteria. You can evaluate the financial health of a municipality individually or as compared to a peer group. The fundamental data is sourced from municipal filings.

MIFA <GO>

Use MIFA to display current and historical financial information for the 50 US states, District of Columbia, Puerto Rico, and the US Trust Territories. The corresponding financial data has been entered into standard templates for easy comparison of issuers. The data has been compiled from the annual financials filed with Bloomberg's NRMSIR (Nationally Recognized Municipal Securities Information Repository).

CDRA <GO>

Use CDRA to display a calendar of upcoming, current and past fixed-rate municipal bond issues. You can filter the calendar of bond issues that appear by a variety of criteria.

PICK <GO>

Use PICK to post and monitor primary and secondary municipal bond offerings/trades. You can monitor all offerings/trades, target bonds with conventional characteristics or create a custom bulletin board of offerings/trades that match your investment strategies. PICK helps buy-side and sell-side firms gauge the supply of bonds in the marketplace.

APPENDIX

MSRC <GO>

Use MSRC to search the universe of municipal bonds available on the Bloomberg Professional service using custom criteria. You can also save your custom searches and run reports with summary information for the bonds returned by the search.

MBWD <GO>

MBWD displays a list of municipal bids-wanted items for a specific firm. If you are a sell-side firm, you can use MBWD to submit bids via the Bloomberg Professional service to buy-side firms that have privileged you to receive their bids- wanted list. If you are a buy-side firm, you can use MBWD to display your own bids-wanted lists. You must be authorized to use this function.

MSRB <GO>

Use MSRB to display transaction reports designed by Bloomberg based on data received from the Municipal Securities Rule making Board (MSRB). These reports contain interdealer and dealer-customer transaction prices, as well as the number of trades and their par value. This information can help you determine the current market value of a municipal bond.
